Why a new journal on optimization and control?

Optimization and control are subjects that involved in many aspects in our daily and academic lives. This involvement could be seen very clearly while it could be hidden in deep relations. In fact both subjects are some sort of reflections of applied mathematics to real life, and sometimes fed by biology's inspiration. These subjects treated as pure sciences also they can be considered as part of art.

Although many existing journals publish research on parallel; unclear problems, different solution approaches and their limits are worth the struggle and try to provide benefits for different shareholders which is necessary. Our belief is that considered subjects are significant since they related to different daily life problems that create a good reason to interest in optimization and control. There are other reasons for dealing with difficulties of starting to run a journal about these subjects; understand, discover, and try to solve the reflections of optimization in our lives, are some of them. The subjects also create an attraction that we cannot yield. Faith and pleasure are keeping us working on them continually.

We are also aware that we may not be rewarded materially by giving a start such a journal about these challenging subjects. However, we as a group with a collective interest are to make constant progress, and we all feel that this journal is a right place for sharing different perceptions and believes whoever contributes – this is what we gain.

We hope this journal will bring us indulgence, cooperation, kindness, understanding of life and academic enlightenment; and one day you will be able to find some sharing points via this journal. For every one, you are welcome.

Sincerely,

On behalf of all of us,

Founding and Managing Editor
